PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No.		Applicant(s)	
	10/613,967		BRUYNSTEEN, GEERT FRANK	
	Examiner		Art Unit	
	Scott Beliveau		2623	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 26 March 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 21-31 and 33-40 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 21-31 and 33-40 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 26 February 2007 has been entered.

Response to Arguments

2. Applicant's arguments with respect to claims 21-31 and 33-40 have been considered but are moot in view of the new ground(s) of rejection.

Applicants argue that the combination of Levin et al. and Nishio fail to teach and or suggest the limitation such that the "change to the software controls a data format of the content information for play out". The examiner respectfully disagrees. As described in the specification the particular usage of the term 'data format' coincides with a particular level of quality (ex. CD-like quality - 'high quality' versus MP3-like quality - 'lower quality') (IA: Page 3, Lines 21-26). Accordingly, in light of the specification, a particular 'image resolution' (high versus low) meets the claimed limitation. As previously indicated, the examiner has interpreted the varying decoding coefficient [104] as an instruction that controls and/or alters the particular decoding algorithm in the MPEG decoder [11] or 'rendering circuit' in order to generate/render a particular quality of content (Col 5, Lines 3-

Art Unit: 2623

10). Nishio further teaches that the quality is varied based upon the ‘format’ of the output signal – namely the data format is either a fully decoded signal (high quality) or a partially decoded signal (low quality) (Col 4, Line 51 – Col 5, Line 42). The decoding coefficient [104] therefore effects a “change to the software [to] control a data format of the content information for play out”.

With respect to the amendment to claim 30, wherein the “specific quality determines a resolution of the rendered content information and a color depth of the rendered content information”, it is respectfully noted that the previously presented claim did not require both a resolution and a color depth.

Claim Rejections - 35 USC § 112

3. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

4. Claims 30, 31, and 33 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Amended claim 30 requires that the “specific quality determines a resolution of the rendered content information and a color depth of the rendered content information”. The specification as originally filled only describes that the user can specify

Art Unit: 2623

the resolution or color depth of the video to be rendered (IA: Page 6, Lines 8-11), but does not describe that the specific quality necessary determines both.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims 21-28 and 34-40 are rejected under 35 U.S.C. 103(a) as being unpatentable over Levin et al. (US Pat No. 6,654,546 B1) in view of Nishio et al. (US Pat No. 6,345,388 B1).

In consideration of claim 21, the Levin et al. reference discloses a “method of enabling an end-user to locally processes content information at a quality level remotely adjustable by a service provider”. In particular the method comprises “communicating over a data network” (ex. telephone network) (Col 3, Lines 1-16) “with an end user apparatus for rendering content information” [101] associated with video programming (Col 2, Lines 17-41). The “end-user apparatus” [101] may subsequently be “configured . . . to locally adjust the quality of content information rendered through the end-user apparatus, the adjustment to quality being based on. . . a change in the storage capacity for storing content information in a storage device associated with the end-user apparatus” (Col 3, Line 56 – Col 4, Line 8). For example, a recording device may be shipped that is only allowed to record and subsequently render the correspondingly stored low quality of video. Therefore, the system when shipped would initially be unable to store/render high quality video. The particular service provider upgrade

Art Unit: 2623

would subsequently enable the system to adjust the quality of stored/rendered video in connection with the capability to store a higher quality video than was originally possible.

The Levin et al. reference explicitly incorporates by reference US App No. 09/132,690 with respect to details pertaining the “apparatus” [101] (Col 1, Lines 6-18). As illustrated in Figure 2, the “storage device” further comprises “software controlling a rendering circuit” [156] “associated with the end user apparatus” (Page 11, Line 24 – Page 12, Line 5; Page 13, Lines 15-28). The Levin et reference, however, is silent with respect to a “change to the software controlling a rendering circuit”.

In an analogous art pertaining to consumer electronic devices which provide a service relating to the processing of the content information local at the end-user’s equipment, the Nishio et al. reference discloses a television receiving apparatus [1] wherein an “adjustment to quality [is] based on . . . a change to the software controlling a rendering circuit associated with the end user apparatus wherein the change to the software controls a data format of the content information for play out” (Col 4, Line 64 – Col 5, Line 43). Accordingly, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify Levin et al. with the teachings of Nishio et al. so that the “adjustment to quality [is] based on (1) a change in the storage capacity for storing content information in a storage device associated with the end-user apparatus, and (2) a change to the software controlling a rendering circuit associated with the end user apparatus wherein the change to the software controls a data format of the content information for play out” for the purpose of providing a means to store/render a video image at a particular quality level based upon based upon a subscriber requested accounting level (Nishio et al.: Col 1, Lines 42-47).

Claim 22 is rejected wherein the “end-user receives a higher quality in return for a higher fee” (Levin et al.: Col 3, Lines 16-25; Col 3, Line 56 – Col 4, Line 8).

Claim 23 is rejected in light of the combined teachings wherein both references teach that the “content information comprises video data” (Levin et al.: Col 2, Lines 17-28; Nishio et al.: Abstract). Levin et al. suggest the particular usage of levels of quality and Nishio et al. reference teaches that “quality level relates to at least one of a color depth and a resolution of the video data when rendered” (Col 5, Lines 29-42).

Claim 24 is rejected as aforementioned wherein “adjusting the quality of the storing comprises regulating a storage capacity of the storage device” (Levin et al.: Col 3, Line 56 – Col 4, Line 8).

Claim 25 is rejected wherein the “regulating of the storage capacity comprises providing end-user access to a selected portion of a local storage” (Levin et al.: Col 3, Lines 26-38).

Claim 26 is rejected wherein the “local storage” [112] comprises a “HDD” and the “storage capacity is regulated by controlling a mechanical component of the HDD” associated with the physical circuitry of the drive (Levin et al.: Col 2, Lines 63-65). For example, limiting the particular ability for the drive to access all sectors associated with its full storage capacity effectively controls the mechanical components of the HDD so as to not read/write to those sectors.

In consideration of claim 27, Levin et al. discloses that the “storage capacity is regulated by controlling an address range of the memory” (Col 2, Lines 55-63). The reference does not explicitly teach that the “local storage comprises a solid state memory”, however, the reference teaches that the invention may be implemented using other forms of mass storage

Art Unit: 2623

(Col 2, Lines 38-41). Applicant's admission of fact provides evidence as to the existence of "solid state memory" as a form of mass storage (ex. FLASH memory). Accordingly, it would have been obvious to one having ordinary skill in the art at time the invention was made so as to modify Levin et al. such that the "local storage comprises a solid state memory" for the purpose of using a utilizing a form of storage which is small, rugged, and consumes less power than corresponding magnetic drives.

In consideration of claim 28, as aforementioned, the Levin et al. discloses that the "storage capacity is regulated by controlling a mechanical component" of the local storage device [112] (Levin et al.: Col 3, Lines 26-38). The reference, however, does not explicitly disclose that the "local storage comprises a ODD", however, the reference teaches that the invention may be implemented using other forms of mass storage (Col 2, Lines 38-41). Applicant's admission of fact provides evidence as to the existence of "ODD" as a form of mass storage. Accordingly, it would have been obvious to one having ordinary skill in the art at time the invention was made so as to modify Levin et al. such that the "local storage comprises a ODD" for the purpose of using a utilizing a form of storage that is robust in that the stored data cannot be corrupted in the presence of magnetic fields.

Claim 34 is rejected in view of the combined references. As illustrated in Figure 1, the Levin et al. reference discloses an "end-user system". The "system" comprises an "output" [105] for "rendering of content information to an end user" such as that associated with video programming. A "communication interface" [115] for "communicating over a data network with a third party server for remotely adjusting the rendering of content information on the end-user system" wherein the "quality of content information rendered through the output

Art Unit: 2623

[is] adjustable by the server [and] the adjustment to quality [is] based on . . . a change in the storage capacity for storing content information in a storage device” [112] “associated with the end user apparatus” (Col 3, Line 1 – Col 4, Line 8).

The Levin et al. explicitly incorporates by reference US App No. 09/132,690 with respect to details pertaining the recording device [101] (Col 1, Lines 6-18). As illustrated in Figure 2, the “storage device” further comprises a “software controlling a rendering circuit” [156] “associated with the end user system” (Page 11, Line 24 – Page 12, Line 5; Page 13, Lines 15-28). The Levin et reference, however, is silent with respect to a “change to the software controlling a rendering circuit”.

In an analogous art pertaining to consumer electronic devices which provide a service relating to the processing of the content information local at the end-user’s equipment, the Nishio et al. reference discloses a television receiving apparatus [1] wherein an “adjustment to quality [is] based on . . . a change to the software controlling a rendering circuit associated with the end user wherein the change to the software controls a data format of the content information for play out” (Col 4, Line 64 – Col 5, Line 43). Accordingly, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify Levin et al. with the teachings of Nishio et al. so that the “adjustment to quality [is] based on (1) a change in the storage capacity for storing content information in a storage device associated with the end-user apparatus, and (2) a change to the software controlling a rendering circuit associated with the end user wherein the change to the software controls a data format of the content information for play out” for the purpose of providing a means to

Art Unit: 2623

store/render a video image at a particular quality level based upon based upon a subscriber requested accounting level (Nishio et al.: Col 1, Lines 42-47).

Claim 35 is rejected wherein the “storage capacity of the storage device is remotely adjustable” (Levin et al.: Col 2, Line 66 – Col 3, Line 38).

Claim 36 is rejected in light of the combined teachings such that the “software is remotely adjustable” in accordance with providing field upgrades to the recording/playback unit so as to provide particular quality levels of output (Levin et al.: Figure 1; Col 3, Line 56 – Col 4, Line 8).

Claim 37 is rejected wherein the “storage device” [101] “comprises at least one of: a HDD” (Levin et al.: Col 2, Lines 28-28).

Claim 38 is rejected wherein the “quality of content information comprising video information is remotely adjustable and the output apparatus comprises a video display” (Levin et al.: Figure 1; Col 2, Lines 23-27; Col 3, Line 56 – Col 4, Line 8).

Claim 39 is rejected wherein the “output comprises a television display” [105] (Levin et al.: Figure 1).

Claim 40 is rejected wherein the “storage device comprises a PVR” (Levin et al.: Col 1, Lines 49-53).

7. Claims 21-28, 30, 31, and 33-40 are rejected under 35 U.S.C. 103(a) as being unpatentable over Levin et al. (US Pat No. 6,654,546 B1) in view of Dierke (US Pat No. 6,192,188 B1).

In consideration of claim 21, the Levin et al. reference discloses a “method of enabling an end-user to locally processes content information at a quality level remotely adjustable by a

service provider”. In particular the method comprises “communicating over a data network” (ex. telephone network) (Col 3, Lines 1-16) “with an end user apparatus for rendering content information” [101] associated with video programming (Col 2, Lines 17-41). The “end-user apparatus” [101] may subsequently be “configured . . . to locally adjust the quality of content information rendered through the end-user apparatus, the adjustment to quality being based on. . . a change in the storage capacity for storing content information in a storage device associated with the end-user apparatus” (Col 3, Line 56 – Col 4, Line 8). For example, a recording device may be shipped that is only allowed to record and subsequently render the correspondingly stored low quality of video. Therefore, the system when shipped would initially be unable to store/render high quality video. The particular service provider upgrade, would subsequently enable the system to adjust the quality of stored/rendered video in connection with the capability to store a higher quality video than was originally possible.

The Levin et al. reference explicitly incorporates by reference US App No. 09/132,690 with respect to details pertaining the “apparatus” [101] (Col 1, Lines 6-18). As illustrated in Figure 2, the “storage device” further comprises “software controlling a rendering circuit” [156] “associated with the end user apparatus” (Page 11, Line 24 – Page 12, Line 5; Page 13, Lines 15-28). The Levin et reference, however, is silent with respect to a “change to the software controlling a rendering circuit”.

In an analogous art pertaining to consumer electronic devices which provide a service relating to the processing of the content information local at the end-user’s equipment, the Dierke reference teaches that an “adjustment to quality [is] based on . . . a change to the software controlling a rendering circuit associated with the end user apparatus wherein the

Art Unit: 2623

change to the software controls a data format of the content information for play out” (Col 3, Lines 36-40; Col 5, Lines 13-25; Col 8, Lines 50-53; Col 9, Lines 9-20). Accordingly, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify Levin et al. with the teachings of Dierke so that the “adjustment to quality [is] based on (1) a change in the storage capacity for storing content information in a storage device associated with the end-user apparatus, and (2) a change to the software controlling a rendering circuit associated with the end user apparatus” for the purpose of providing a flexible means for enabling providers to easily/flexibly improve encoder/decoder processes (Dierke: Col 2, Lines 2-11).

Claim 22 is rejected wherein the “end-user receives a higher quality in return for a higher fee” (Levin et al.: Col 3, Lines 16-25; Col 3, Line 56 – Col 4, Line 8).

Claim 23 is rejected in light of the combined teachings wherein both references teach that the “content information comprises video data” (Levin et al.: Col 2, Lines 17-28). Levin et al. suggest the particular usage of levels of quality and the Dierke reference teaches that “quality level relates to at least one of a color depth and a resolution of the video data when rendered” (Col 3, Lines 35-40).

Claim 24 is rejected as aforementioned wherein “adjusting the quality of the storing comprises regulating a storage capacity of the storage device” (Levin et al.: Col 3, Line 56 – Col 4, Line 8).

Claim 25 is rejected wherein the “regulating of the storage capacity comprises providing end-user access to a selected portion of a local storage” (Levin et al.: Col 3, Lines 26-38).

Claim 26 is rejected wherein the “local storage” [112] comprises a “HDD” and the “storage capacity is regulated by controlling a mechanical component of the HDD” associated with the physical circuitry of the drive (Levin et al.: Col 2, Lines 63-65). For example, limiting the particular ability for the drive to access all sectors associated with its full storage capacity effectively controls the mechanical components of the HDD so as to not read/write to those sectors.

In consideration of claim 27, Levin et al. discloses that the “storage capacity is regulated by controlling an address range of the memory” (Col 2, Lines 55-63). The reference does not explicitly teach that the “local storage comprises a solid state memory”, however, the reference teaches that the invention may be implemented using other forms of mass storage (Col 2, Lines 38-41). Applicant’s admission of fact provides evidence as to the existence of “solid state memory” as a form of mass storage (ex. FLASH memory). Accordingly, it would have been obvious to one having ordinary skill in the art at time the invention was made so as to modify Levin et al. such that the “local storage comprises a solid state memory” for the purpose of using a utilizing a form of storage which is small, rugged, and consumes less power than corresponding magnetic drives.

In consideration of claim 28, as aforementioned, the Levin et al. discloses that the “storage capacity is regulated by controlling a mechanical component” of the local storage device [112] (Levin et al.: Col 3, Lines 26-38). The reference, however, does not explicitly disclose that the “local storage comprises a ODD”, however, the reference teaches that the invention may be implemented using other forms of mass storage (Col 2, Lines 38-41). Applicant’s admission of fact provides evidence as to the existence of “ODD” as a form of

Art Unit: 2623

mass storage. Accordingly, it would have been obvious to one having ordinary skill in the art at time the invention was made so as to modify Levin et al. such that the “local storage comprises a ODD” for the purpose of using a utilizing a form of storage that is robust in that the stored data cannot be corrupted in the presence of magnetic fields.

Claim 30 is rejected in light of the combined teachings as aforementioned. The reference discloses a “CE apparatus” [101] for “processing content information received via a data network” (Col 2, Lines 28-41). The “apparatus” [101] enables “an end-user to select a specific one of multiple quality levels of the processing” and a “controller” [114] “coupled to a storage device” [112]” for “setting the specific quality level in response to a signal supplied by a third party . . . wherein a specific quality level corresponds to a specific storage capacity allocated for the content information by the controller according to the signal” (Col 3, Line 56 – Col 4, Line 8). The “apparatus” [101] is “configured to receive the content information and the signal via a data network” (Col 2, Lines 28-41; Col 3, Lines 1-16) and the “controller” [114] “sets . . . the specific quality . . . based on (1) a change in the storage capacity for storing content information” (Col 3, Line 56 – Col 4, Line 8). For example, a recording device may be shipped that is only allowed to record and subsequently render the correspondingly stored low quality of video. Therefore, the system when shipped would initially be unable to store/render high quality video. The particular service provider upgrade would subsequently enable the system to adjust the quality of stored/rendered video in connection with the capability to store a higher quality video than was originally possible.

The Levin et al. further explicitly incorporates by reference US App No. 09/132,690 with respect to details pertaining the “apparatus” [101] (Col 1, Lines 6-18). As illustrated in

Figure 2, the “apparatus enables processing comprising playing out the content information” and further comprises a “circuit for rendering the content information” [156] as well as software controlling a rendering circuit” [156] (Page 11, Line 24 – Page 12, Line 5; Page 13, Lines 15-28). The aforementioned “controller” [114] of Levin et al. is “coupled to the data rendering circuit” [156]. Levin et al., however, is silent with respect to the “controller . . . setting the specific quality of the rendering under control of the signal” as well as a “change to the software controlling a rendering circuit”.

In an analogous art pertaining to consumer electronic devices that provide a service relating to the processing of the content information local at the end-user’s equipment, the Dierke reference teaches that a “controller” [132] is “coupled to the data rendering circuit” [134] “for setting the specific quality of the rendering under control of the signal”. The “setting of the specific quality is based on . . . a change to the software controlling a rendering circuit and wherein the specific quality determines a resolution of the rendered content information and a color depth of the rendered content information” (Col 3, Lines 36-40; Col 5, Lines 13-25; Col 8, Lines 50-53; Col 9, Lines 9-20). Accordingly, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify Levin et al. with the teachings of Dierke so that the “controller is coupled to the rendering circuit for setting the specific quality of the rendering under control of the signal, wherein the setting of the specific quality is based on (1) a change in the storage capacity for storing content information, and (2) a change to the software controlling a rendering circuit and wherein the specific quality determines a resolution of the rendered content information and a color depth of the rendered content information” for the purpose of providing a flexible

Art Unit: 2623

means for enabling providers to easily/flexibly improve encoder/decoder processes (Dierke: Col 2, Lines 2-11).

Claim 31 is rejected wherein the “storage device” [101] “comprises at least one of: a HDD” (Levin et al.: Col 2, Lines 28-28).

Claim 33 is rejected as aforementioned wherein the Levin et al. reference discloses that the “content information comprises video data” (Col 2, Lines 17-28).

Claim 34 is rejected in view of the combined references. As illustrated in Figure 1, the Levin et al. reference discloses an “end-user system”. The “system” comprises an “output” [105] for “rendering of content information to an end user” such as that associated with video programming. A “communication interface” [115] for “communicating over a data network with a third party server for remotely adjusting the rendering of content information on the end-user system” wherein the “quality of content information rendered through the output [is] adjustable by the server [and] the adjustment to quality [is] based on . . . a change in the storage capacity for storing content information in a storage device” [112] “associated with the end user apparatus” (Col 3, Line 1 – Col 4, Line 8).

The Levin et al. explicitly incorporates by reference US App No. 09/132,690 with respect to details pertaining the recording device [101] (Col 1, Lines 6-18). As illustrated in Figure 2, the “storage device” further comprises a “software controlling a rendering circuit” [156] “associated with the end user system” (Page 11, Line 24 – Page 12, Line 5; Page 13, Lines 15-28). The Levin et reference, however, is silent with respect to a “change to the software controlling a rendering circuit”.

In an analogous art pertaining to consumer electronic devices which provide a service relating to the processing of the content information local at the end-user's equipment, the Dierke reference teaches that an "adjustment to quality [is] based on . . . a change to the software controlling a rendering circuit associated with the end user apparatus wherein the change to the software controls a data format of the content information for play out" (Col 3, Lines 36-40; Col 5, Lines 13-25; Col 8, Lines 50-53; Col 9, Lines 9-20). Accordingly, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify Levin et al. with the teachings of Dierke so that the "adjustment to quality [is] based on (1) a change in the storage capacity for storing content information in a storage device associated with the end-user apparatus, and (2) a change to the software controlling a rendering circuit associated with the end user apparatus" for the purpose of providing a flexible means for enabling providers to easily/flexibly improve encoder/decoder processes (Dierke: Col 2, Lines 2-11).

Claim 35 is rejected wherein the "storage capacity of the storage device is remotely adjustable" (Levin et al.: Col 2, Line 66 – Col 3, Line 38).

Claim 36 is rejected in light of the combined teachings such that the "software is remotely adjustable" in accordance with providing field upgrades to the recording/playback unit so as to provide particular quality levels of output (Levin et al.: Figure 1; Col 3, Line 56 – Col 4, Line 8).

Claim 37 is rejected wherein the "storage device" [101] "comprises at least one of: a HDD" (Levin et al.: Col 2, Lines 28-28).

Art Unit: 2623

Claim 38 is rejected wherein the “quality of content information comprising video information is remotely adjustable and the output apparatus comprises a video display” (Levin et al.: Figure 1; Col 2, Lines 23-27; Col 3, Line 56 – Col 4, Line 8).

Claim 39 is rejected wherein the “output comprises a television display” [105] (Levin et al.: Figure 1).

Claim 40 is rejected wherein the “storage device comprises a PVR” (Levin et al.: Col 1, Lines 49-53).

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Scott Beliveau whose telephone number is 571-272-7343. The examiner can normally be reached on Monday-Friday from 8:30 a.m. - 6:00 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner’s supervisor, John W. Miller can be reached on 571-272-7353. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or
